Managed Inventory

Maximum Control Over Your IT Resources

In rapidly growing business environments where new devices and licenses are continually needed, and employee numbers are constantly on the rise, it can be challenging to keep track. However, precise IT documentation and inventory management are essential to ensure smooth operations. This is where Managed Inventory comes into play – an innovative solution that significantly reduces administrative efforts, allowing you to focus on your core tasks. Discover how Managed Inventory enhances efficiency, transparency, and control over your IT infrastructure, leading to improved performance and cost optimization.

Why You Need Managed Inventory:

- Are you taking too long to complete a comprehensive hardware inventory? We digitize and automate up to 80% of hardware inventory, allowing us to conduct a full IT inventory within a few days.

- You want to rely on very high data quality? With our Managed Inventory, you minimize the risk of inaccurate data and incorrect conclusions. Automatically captured assets are precisely documented, with unrecorded assets being the only uncertainty. Depend on reliable data for well-informed decisions.

- Do you want automatic IT documentation without much effort? Without Managed Inventory, creating a professional and comprehensive IT documentation is a full-time job. With our Managed Inventory, you can save yourself this effort and receive reports automatically.

- Do you need a foundation for IT security concepts? We regularly generate audited reports. These audited reports ensure that due diligence has been performed. Responsible authorities can thus, for example, verify that all production systems are up-to-date with the latest security patches.

- Do you need automatic documentation for decentralized locations and clients? Many companies have small, decentralized locations where it's not cost-effective to employ their own IT teams. However, managing hardware and services outside of your own network can be challenging. With Managed Inventory, we provide you with comprehensive IT documentation of your entire IT infrastructure. By entrusting the responsibility for documenting decentralized IT systems to your IT department at the main location, you enable them to save time by avoiding travel or irregular remote sessions.

Our Report Packages at a Glance:

The Basic Package includes:
Windows Systems, Linux Systems, macOS Systems, SNMP Devices, IPv4 Overview, HP Unix Systems, Infrastructure Overview, and System Overview

The Professional Package includes:
All reports from the Basic Package and additionally:
